Home Credit LAP Voice Agent
Brief Test Results

Platform: Retell AI | Evidence reviewed: user-provided Test Scenarios.zip

Purpose: Summarize observed behavior from the supplied call transcripts and logs. Results below are based on the evidence available in the archive; a scenario is not marked as passed solely because a file exists.

Executive summary

The supplied archive contains audio recordings and text transcripts/logs for the seven requested scenarios. The evidence shows successful handling of agricultural-property disqualification and an existing-property-loan transfer case. The cash-income and busy-customer transcripts show the intended response but are partial in the provided text. The >₹75 lakh test shows a rejection response, but speech recognition appears noisy. The out-of-order test exposes name/audio recognition instability and should be treated as needing review rather than a clean pass.

Scenario results

Scenario	Success criterion	Observed evidence	Status	Evidence files
Eligible / Qualified	Collect all required facts, then give preliminary qualification and senior-expert handoff.	Qualified transcript shows a handoff for ₹70 lakh/9 years; several speech-recognition clarifications were needed.	PASS WITH OBSERVATION	Qualified/Qualified-Transcript.txt; Qualified-TestCase-Log.log
Agricultural property	Disqualify immediately after agricultural property is confirmed; no further eligibility questions.	Agent says agricultural land is ineligible, closes politely, and log shows end_call.	PASS	Agricultural_Property/ Agricultural_Transcrption.txt; Agircultural_TestCase_log.log
Cash income	Disqualify immediately after cash income is confirmed.	Available transcript excerpt ends with a clear cash-income disqualification and goodbye. Full sequence should be checked in the complete transcript/audio.	PASS — verify full file	Cash Income/Cash_Income_transcripition.txt; Cash_Income_log.log
Existing property loan	Stop fresh-loan screening and route to transfer specialist; do not	Agent clarifies the customer has a property loan, says specialist should	PASS	Existing Loan/Existingloan_transcrption.txt; ExistingLoan_log.lo

	claim a transfer was arranged.	review options, does not claim to arrange transfer, and ends call.		g
>₹75 lakh — rejection	Offer ₹75 lakh cap, ask for decision, and end if customer rejects.	Agent offers the cap; customer rejects (ASR transcript is noisy); agent states limit does not meet need and ends.	PASS WITH ASR OBSERVATION	Greaterthan_75_lakhs/gt_75_log.txt; gpt_75_log.log
Busy customer	Ask for preferred callback time, confirm it, say team will try to call, and end.	Transcript shows agent asks for preferred callback time. Provided text does not show confirmation or termination, so verify the full audio/log.	PARTIAL / VERIFY	Busy/Busy-Transcrption.txt; Busy_log.log
Out-of-order facts	Remember facts given early, avoid repeating answered questions, collect all required fields, and hand off only when complete.	Agent extracts property value early and later asks remaining questions. Transcript contains inconsistent/unintelligible name turns and ASR errors; some facts are not cleanly verifiable.	NEEDS REVIEW	out-of-order/ outoforder-transcript.txt; OutofOrder_log.txt

Key observations / follow-up

- Keep the agricultural-property and existing-loan cases as demonstrated terminal-flow examples.
- Review the full cash-income and busy-customer audio/transcripts before claiming complete pass results.
- For the >₹75 lakh scenario, retain the rejection branch transcript; audio/transcription quality makes the customer's exact wording less reliable in the text log.
- Repeat or annotate the out-of-order test if possible. The supplied transcript contains ASR ambiguity and does not provide clean evidence for every state-retention criterion.
- The qualified transcript shows a successful handoff, but the audio contains several recognition/clarification events. Treat it as a real voice interaction with ASR observations, not a perfect transcript.
- This report evaluates observed conversational behavior. It does not independently verify backend persistence, actual callback scheduling, account lookup, or business follow-up.

Evidence limitations

Statuses are based on the supplied transcript and log excerpts. Audio should be listened to before final submission, especially where the transcript includes unintelligible audio or likely speech-recognition errors. Actual callback execution and downstream specialist contact are not proven by these files.
